Experience

NimbleRx Redwood City, CA

Senior Software Engineer *Jul 2026 – Present*

- Integrated Remedy (an acquired YC startup)'s **AI voice agent** for pharmacy inbound calls onto pharmacy system-agnostic tool calls (patient identification, refills, online checkout); now handling **∼1,500 calls/week**.
- Led v2 voice agent design and built **7 new tool calls** (order history, SMS app links); a per-call randomized A/B cut upfront requests to speak to a human from **31.6% to 10.6%** and raised agent self-served calls from 7.4% to 12.3%.
- Refactored the core pharmacy-product tier model referenced 500+ times across 4 monorepos, replacing **13 conflicting DB fields** and scattered tier-access logic with a simple state machine for 7,000+ pharmacies; rebuilt 7 years of product history and coordinated a 9-engineer migration with zero downtime.
- Modeled per-courier holiday delivery schedules for 13 couriers (led outreach to 8 regional vendors), auto-renewed yearly via a holiday API cron; prevented incorrect delivery dates for 12k orders at 163 pharmacies.
- Led a cleanup across 18 engineers that cut stale feature flags **40%** (85 → 51), then built a **GitHub Action cron** that has opened 34 code cleanup PRs using Statsig/Claude APIs and posts a weekly Slack digest with links and trends.

Software Engineer *Sep 2025 – Jun 2026*

- Rebuilt **∼$210k/month** in pharmacy incentive payouts as an automated monthly cron: per-pharmacy calculations, a Retool UI for Finance approval, and payout emails via SendGrid, replacing hand-run SQL and manual emails.
- Shipped bulk package label printing for high-volume delivery pharmacies (∼7.6k multi-selects/week, 87k labels across 165 stores); unblocked bulk print for 2 couriers by organizing API migration for ∼8,500 orders with zero downtime.
- Fixed root causes across **56 pharmacy-reported bug cases** (#1 of 17 engineers), including a delivery integration that had never placed an order (now ∼5.2k/month) and ∼214k unwanted texts/week to excluded patients.
- Identified ∼56k lines of dead code (6 courier vendors, multiple unused app features), and built OpenAPI audience grouping for the backend monorepo that cut generated client code by **∼174k lines** (#1 in lines deleted org-wide).
- Cut a pharmacy-system integration's p95 latency **94%** (15.8s → 864ms) for FIXME pharmacies by batching N+1 SQL queries, using JPA projections, and caching stable data in Redis.
- Built 2 zero-to-one pilots for experimental products: an at-the-counter **Expo** tablet app for order alerts (15 pharmacies, 30k push notifications) and async in-store payment for pharmacy checkouts using a Stripe card-reader.

Software Engineer Intern *Sep 2024 – Dec 2024*

- Unblocked launch of **85 pharmacies** by building a React tool for itemized Stripe transactions required for audits.
- Eliminated **86k invalid REST API errors/day** by updating Java Spring controllers and React flows to return correct empty-list responses for missing resources, improving real error observability in Elastic APM.
- Cut file-upload latency **30% platform-wide** by fixing S3 content-length headers and a high-overhead writer.

RBC Royal Bank Toronto, ON

Software Developer Intern *May 2024 – Aug 2024*

- Led 4 interns prototyping a real-time **LLM note-taking assistant** for SREs that logged incident timelines and resolution notes via a Webex-to-OpenAI integration built using FastAPI, MongoDB, and WebSockets.
- Submitted as a co-inventor for a US patent application; 1 of 8 Amplify projects in a decade rolled out bank-wide.

Projects

What to Code | *Next.js, LangChain, Vercel, Supabase* TODO REMOVE

- Built LLM idea generation → semantic GitHub starter template recommendation for devs using pgvector search.
- Launch posts as part of Buildspace (YC S20) drew **500+ reactions** and **100+ app-link requests** on social media.

Technical Skills

Programming Languages: TypeScript, JavaScript, Python, Java, SQL, Rust, C/C++, HTML/CSS
Frameworks: React, Next.js, Spring Boot, React Native/Expo, Node.js, FastAPI, Pipecat
Databases & Infrastructure: PostgreSQL, Redis, MongoDB, AWS (S3, SQS), Docker
Testing & Developer Tools: Jest, JUnit, Pytest, Playwright, Git, ELK/Kibana, Grafana, PostHog, Metabase, Statsig

Education

University of Alberta – B.Sc. Computer Engineering, Software FIXME 3.96 GPA | 2025
